This report contains a row labeled that counts searches that were performed on all databases available to your account. If a users selects All Databases (from the database selection screen) and performs a search, the counts in the row and the

rows of each individual databases are incremented. By including this row in your report it is possible to find out how many times a database was uniquely selected and searched. To determine this value, you would subtract the values in the row containing from the values in the row containing the database specific searches. You should not include this row in your total calculations as you could potentially double your search count. If the databases your location subscribes to changes during the report period selected, this calculation may not be valid. Searches listed in the zero hit count column are included in the total search count for that database.
